

A complex network graph visualization. The graph consists of numerous nodes connected by gray lines. The nodes vary in size, with some being significantly larger than others, suggesting a hierarchy or importance. The nodes are colored in several ways: many are blue, some are green, one is red, and a few are cyan. The overall structure is a central hub-and-spoke model, with a large cluster of nodes in the upper right and several smaller, more linear branches extending from the center. Some nodes are white with black outlines, possibly representing unclassified or specific types of nodes. The connections are dense in the central area and become sparser as they branch outwards.
